In biological systems, the prevailing theory suggests that legged animals coordinate joint actuation through antagonistic pairs of muscles controlled by spinal sensorimotor circuits, functioning as "myotatic units" (11-15).The myotatic unit concept is mimicked in robotics through the control of joint extension and flexion by

separate actuators at each joint.

Immunofluorescence (IF) technique is widely used for rapid detection of virus infections by identifying virus antigens in clinical specimens [19-22]. IF staining is usually considered very rapid (about 1 to 2 hr) and overall gives a sensitive and specific viral identification [19-22]. Unfortunately, IF technique may not be able to confirm the identity of all virus strains, for instance viruses of ...

Photolithography is a patterning process in chip manufacturing. The process involves transferring a pattern from a photomask to a substrate. This is primarily done using steppers and scanners, which are equipped with optical light sources. Other forms of lithography include direct-write e-beam and nanoimprint. There are also several next-generation lithography (NGL) technologies in R&D, such ...

A typical manual cleaning is conducted by fully stopping the turbine in a low-wind-speed environment. In recent years, automatic blade inspecting and cleaning robots have been developed, such as climbing robots that move along the tower [ 189 ], inchworm-type robots that move along the blade [ 190 ], and unmanned aerial vehicles [ 191 ].

Redistribution layers (RDLs) are the copper metal interconnects that electrically connect one part of the semiconductor package to another. RDLs are measured by line and space, which refer to the width and pitch of a metal trace. Higher-end RDLs may be at 2µm line/space and smaller. The RDL is a layer of wiring metal interconnects... » read more
