To overcome the limitations of the open-loop controller, control theory introduces feedback. A closed-loop controller uses feedback to control states or outputs of a dynamical system. Its name comes from the information path in the system: process inputs (e.g., voltage applied to an electric motor) have an effect on the process outputs (e.g., speed or torque of the motor), which is measured with ...

In psychometrics, item response theory (IRT) (also known as latent trait theory, strong true score theory, or modern mental test theory) is a paradigm for the design, analysis, and scoring of tests, questionnaires, and similar instruments measuring abilities, attitudes, or other variables. It is a theory of testing based on the relationship between individuals' performances on a test item and ...

Biological and therapeutic agents exert their actions by interacting with specific molecular targets. This process of ligand binding takes time, for the ligand to associate with the target, forming the target-ligand complex, and for the complex to break down. These processes are quantified by the association and dissociation rate constants. Knowledge of these rates can be important in the ...
